

Virtual Private Server

FULLY MANAGED VIRTUAL PRIVATE SERVER

Thinking about getting a VPS but not sure which company fits your needs?

You know you want:

- **Uptime
- **High Performance Servers
- **Cutting Edge Technology
- **Fast/Reliable Support
- **A host you KNOW and trust

All VPS's include the following:

- * VZ Technology
- * HyperVM Powerpanel
- * Unlimited domains on all control panel options
- * FREE Setup
- * 24/7 FULLY MANAGED support by seasoned professionals - BASIC SERVER MANAGEMENT (VPS Accounts with no control panel/webmin are self managed)
- * Full Root Access
- * CentOS 5.x OS
- * Easy Upgrade on Fly

New to the VPS market? We have many customers who switch to us from shared/reseller hosting so we give you all the information you need to get your VPS up and running. Worried about security? We will optimize your VPS and install APF firewall upon request.

A Virtual Private Server (VPS) lets you run your sites as if you had your own "dedicated" server, except it is cheaper because you are really just using part of a server that has been split into multiple virtual dedicated servers.

The most important distinction to shared virtual hosting is that you have "root" or admin access and you control your own background processes, such as apache (httpd), qmail (smtpd) and MySQL (databases) So someone else's buggy application or script is not going to crash or interfere with your own processes.

Furthermore you have filesystem security as it effectively jailed or "chrooted" from other users and processes, and you can install your own libraries and software.

Why Virtual Private Server (VPS) ?

>> You need a Virtual Private Server if...

- You need flexible settings and services configuration absolute control
- You are tired of limits on the number of sites, data bases, mail boxes and the like.
- You ever need to install some special software, like, for example, modules for Perl
- You want to run your own services, like, for example, ChatWeb
- You need your own Names Servers
- You want to feel a lot more secure. No one else will have access to your server and you can be positive that you are secure.
- You want to be sure that you will get the resources purchased
- You will need anything of the above mentioned in the near future

Compare to other types of hosting

VPS vs. Virtual Hosting

VPS advantages :

- * Complete access to the system, root-user privileges.
- * No limits on WWW domains, data bases, domain zones, ssh / ftp / email users. VPS has system resources limitations

only.

* With a virtual private server, you can run your own custom firewall. This will enable you to enforce your own control policy that will only allow people you want to be able to access it. All the other hosting provider customers (using many resources) will not affect your VPS.

* You can install the software and applications that you need and want to use on a VPS. This lessens your dependency on web hosts and bypasses the time delays and expenses accrued from them.

VPS disadvantage :

* It may seem too expensive to host your websites on a dedicated server, but when you compare it to shared hosting, the end result is worth it. Moreover, we are ready to offer you really low prices.

VPS vs. Dedicated Server

VPS advantages :

* Dedicated server is much more expensive than VPS.

* Our experts will install all the software for you. This will secure your VPS from infiltration and the use of the old software versions untrustworthy parts. With dedicated server, you will have to do it by yourself. Are you sure you can do it in time and in proper way?

VPS disadvantage :

* Dedicated server has more resources than VPS
